AyuSwar AI

Ayu (life) + Swar (voice) — Voice-First Sovereign Health Assistant for Bharat

One-page solution pitch · Gnani's Great Indian AI Internship Challenge 2026

Live app: ayuswar-ai.vercel.app · Code: github.com/Samrudh2006/Ayuswar-Ai

"What would healthcare software look like if it listened and spoke in the languages India actually uses?"

THE CRISIS IN BHARAT'S CLINICS · WHY I BUILT THIS

In rural Primary Health Centres (PHCs), 1 doctor serves over 2,500 villagers daily; losing 42% of consultation time to manual EHR typing causes severe clinician burnout. Prescriptions fail when patients cannot read English slips, and families are drained by expensive branded medicines. In emergencies, describing acute pain in a second language costs life-saving minutes. AyuSwar AI solves this at the root: replacing keyboards and paper slips with ambient, sovereign Indic voice.

HOW AYUSWAR WORKS (VOICE-FIRST TELEMETRY)

LISTEN
Voice intake in Telugu, Hindi & English

>

UNDERSTAND
Dialect speech mapped to ICD-10 notes

>

ASSIST
SOAP drafts, spoken Rx & triage

>

CONNECT
Hospital maps & WhatsApp handover

GNANI.AI INDIC ENGINE UNDER THE HOOD

PRISMA V3 (STT)

Rayalaseema Telugu dialect ASR + linguistic pitch diarization separating doctor & patient speech in real time without buttons.

TIMBRE V2.5 (TTS)

Nalini 24kHz sovereign neural voice reading prescriptions aloud with 1:1 karaoke highlighting and Telugu cultural food cues.

EVON 30B (LLM)

Maps colloquial Telugu symptom idioms to WHO ICD-10 (e.g. K21.9 for GERD, R00.2) & SNOMED-CT without hallucinations.

THREE PRODUCTION WORKFLOWS

AMBIENT OPD SCRIBE

Transcribes rural consultations in regional Telugu dialects using automated pitch DSP diarization. Suggests WHO ICD-10 & SNOMED-CT codes for physician review with zero manual button pressing. The system assists; it never decides.

Includes PMBJP generic substitution saving up to 86% on routine medication.

SANJIVANI EMERGENCY TRIAGE

Voice symptom intake for 108 emergency triage, rules-based red/yellow/green severity sorting, GPS nearest hospital routing, and structured clinician handover summaries with live ambulance coordination telemetry.

Research simulation; emergency ambulance dispatch is an interface demo.

ACOUSTIC VOICE LAB

Records voice and breathing sounds to compute on-device signal features (pitch F0, jitter, shimmer, Harmonics-to-Noise Ratio, 380–450Hz wheeze harmonics) via Web Audio API with bilingual voice readouts.

Physical signal screening demonstration, not clinical diagnosis.

Plus: **PMBJP Jan Aushadhi** generic savings · **Audio-Rx** spoken prescriptions in native dialect with **WhatsApp** delivery · **ABDM M3 FHIR** zero-network offline sync

ARCHITECTURE & ZERO-MOCK TESTING

React + Vite PWA on Vercel with native Capacitor wrapper. Provider calls route through a secure serverless gateway (/api/gnani/stt, /api/gnani/tts, /api/evon) keeping API keys strictly server-side, rate-limiting requests, and failing closed honestly when unconfigured. Client-side 48kHz audio DSP analysis runs directly on the device. Protected by 74 automated clinical & safety test specifications passing 100% green.

Stated plainly: AyuSwar AI is a working prototype built on synthetic benchmark profiles and open government formularies — not a medical device, not clinically validated, not a diagnostic tool, and designed strictly to keep a certified doctor in the loop. Emergency workflows are labelled simulations; for a real emergency, India dials **112** or **108**.

WHY THIS FITS GNANI'S SOVEREIGN MISSION

India-first healthcare needs Indic-first voice — exactly the stack Gnani has pioneered. AyuSwar shows what that stack achieves end to end: consultation scribing, generic medicine savings, vernacular WhatsApp audio prescriptions, and rural offline continuity. Next on my roadmap: field evaluation with rural ASHA health workers in Andhra Pradesh, real-time SIP telephony integration, and clinical trials.

A personal note from the builder: Growing up in Andhra Pradesh and watching elders in my family struggle to understand English prescription slips at local clinics showed me that healthcare failure in rural India is rarely about medicine—it is about communication. When a patient takes the wrong dose because they cannot read the label, or spends ₹200 on branded tablets when a ₹30 Jan Aushadhi generic exists at the government counter, software has failed them. I built AyuSwar AI solo from Aditya University for this challenge because voice is the only interface that respects people who cannot read or type.

86% Savings
PMBJP Jan Aushadhi Generic Substitution

48kHz DSP
WebAudio Client Wheeze Harmonics (380-450Hz)

74 / 74 Green
Zero-Mock Clinical Invariant Tests Passed

ABDM M3 Ready
FHIR R4 JSON & Encrypted Offline Buffer
